

# DATABASES

INTRODUCTION TO DATA SCIENCE

TIM KRASKA

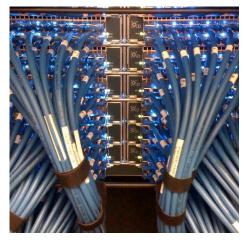

### OTHER ANNOUNCEMENTS

# Want to get involved in research?

We are offering several independent studies and summer research internship.

Sign-up available on: <a href="http://database.cs.brown.edu/">http://database.cs.brown.edu/</a>
or directly: <a href="http://tinyurl.com/zxznf92">http://tinyurl.com/zxznf92</a>

### Possible Topics:

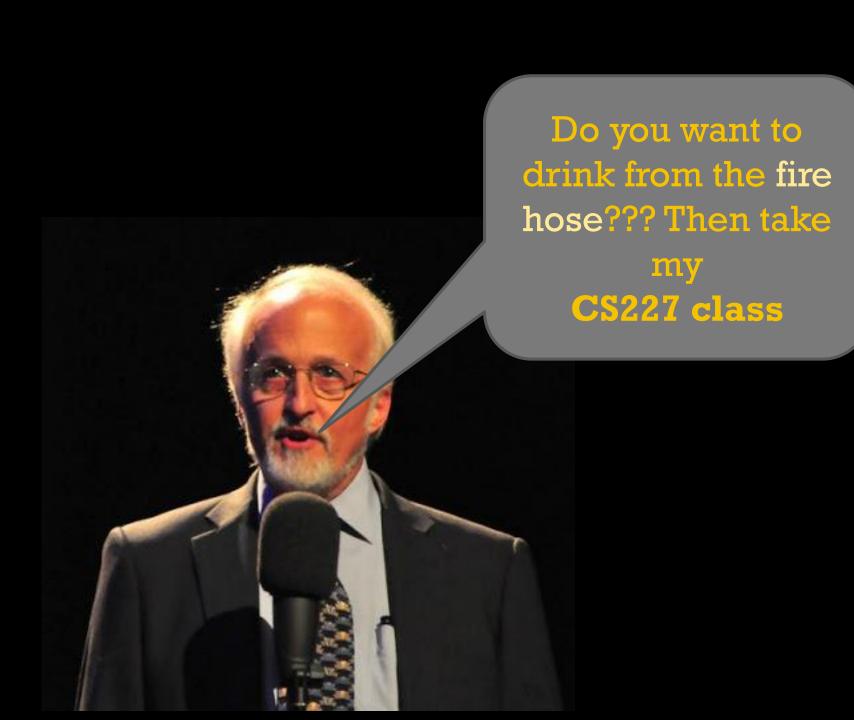

Infiniband

**Tupleware** 

Interactive Data Exploration

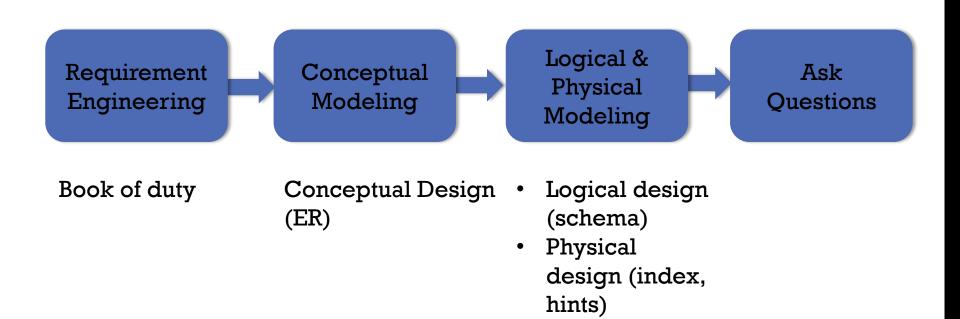

### BOOK

So far:

Database System Concepts Sixth Edition by Silberschatz.

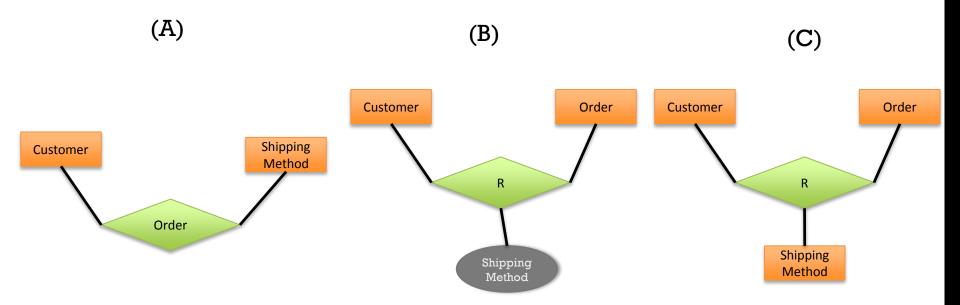

Pieces of chapters 1, 2, 3, 6, 7 and (18)

### DATABASES FOR DATA SCIENTIST

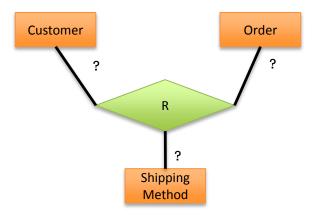

### **CLICKER QUESTION I**

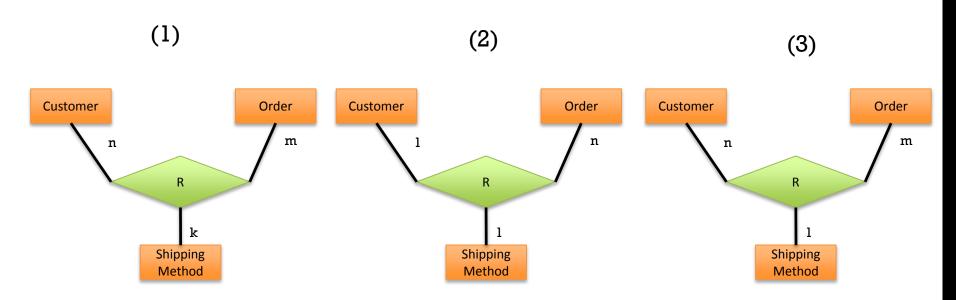

- A customer can have several orders
- An order belongs to a single customer
- Every order has exactly one shipping method (e.g., Post, Fexed, UPS,...)

### **CLICKER QUESTION II**

- A customer can have several orders
- An order belongs to a single customer
- Every order has exactly one shipping method (e.g., Post, Fexed, UPS,...)

### **PROBLEM**

- You are the new Data Scientist at Evil Market
- Evil Market is tracking all customer purchases with their membership or credit card
- They also have data about their customers (estimated income, family status,...) from surveys they have done in the past
- Recently, they are trying to improve their image for young mothers
- As a start they want to know the following information for mothers under 30 for 2015:
  - How much do they spend at Evil Market?
  - How does this compare to all customers under 30?
  - What are their favorite products?
  - Did they spend more in 2015 than in 2014?

Your first project: Design the schema for Evil Market to analyze Evil Market's purchase logs!

### STAR SCHEMA

### DATABASES FOR DATA SCIENTIST

# SQL: RELATIONAL ALGEBRA

### FORMAL DEFINITION OF REL. ALGEBRA

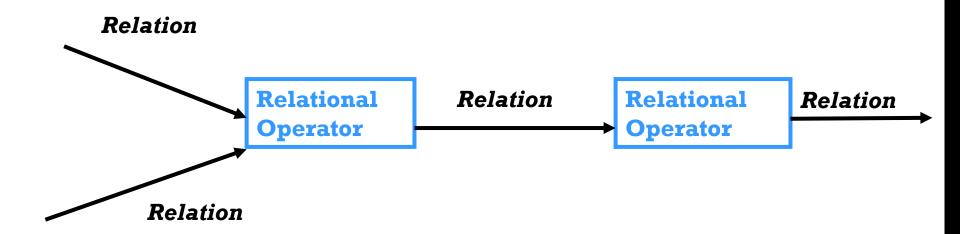

## Atoms (basic expressions)

- A relation in the database
- A constant relation

# **Operators** (composite expressions)

- Selection:  $\sigma$  (E1)
- Projection:  $\Pi$  (E1)
- Cartesian Product: E1 x E2
- **Rename**:  $\rho_{V}(E1)$ ,  $\rho_{A \leftarrow B}(E1)$
- Union:  $E1 \cup E2$
- **Minus**: E1 E2

### CLOSURE PROPERTY / COMPOSABILITY

Professor(<u>Person-ID:integer</u>, Name:varchar(30), Level:varchar(2))

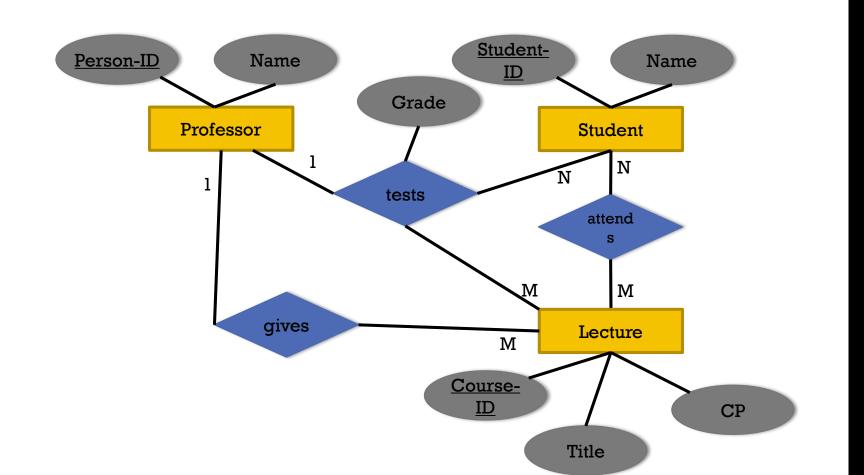

Student(Student-ID:integer, Name:varchar(30), Semester:integer)

Lecture(Course-ID:varchar(10), Title:varchar(50), CP:float)

Gives(Person-ID:integer, Course-ID:varchar(10))

Attends(<u>Student-ID:integer</u>, <u>Course-ID:varchar(10)</u>)

Tests(Student-ID:integer, Course-ID:varchar(10), Person-ID:integer, Grade:char(2))

# SELECTION AND PROJECTION

Professor(<u>Person-ID:integer</u>, Name:varchar(30), Level:varchar(2)) Student(<u>Student-ID:integer</u>, Name:varchar(30), Semester:integer)

### Selection

$\sigma_{\text{Semester} > 10}$ (Student)						
Student-ID Name Semester						
24002	Xenokrates	18				
25403	Jonas	12				

**Projection** 

$\Pi_{Level}$ (Professor)
Level
FP
AP

# RENAME OPERATOR

### **Renaming of relation names**

- Needed to process self-joins and recursive relationships
- E.g., two-level dependencies of lectures ("grandparents")

# SET DIFFERENCE (-)

# Notation: Relation<sub>1</sub> - Relation<sub>2</sub>

### R - S valid only if:

- 1. R, S have same number of columns (arity)
- 2. R, S corresponding columns have same domain (compatibility)

### Example:

loanbnamelnoamountDowntownL-171000RedwoodL-232000PerryL-151500DowntownL-14500PerryL-16300

bname	acct_no	balance

Brighton		
Redwood	A-222	700
Brighton		

account

bname

Mianus
Redwood

(B)

bname

Downtown
Redwood
Perry

Result?

(C)

Downtown Perry

### INTERSECTION

$$\Pi_{Person-ID}(Lecture) \cap \Pi_{Person-ID}(\sigma_{Level=FP}(Professor))$$

# Only works if both relations have the same schema

Same attribute names and attribute domains

### Intersection can be simulated with minus:

$$\mathbf{R} \cap \mathbf{S} = \mathbf{R} - (\mathbf{R} - \mathbf{S})$$

Union works similarly...

### **CODD'S THEOREM**

### 3 Languages:

- Relational Algebra
- Tuple Relational Calculus (safe expressions only)
- Domain Relational Calculus (safe expressions only)

are equivalent.

### Impact of Codd's theorem:

- SQL is based on the relational calculus
- SQL implementation is based on relational algebra
- Codd`s theorem shows that SQL implementation is correct and complete.

### NOT COVERED

Set Division

Aggregate Functions

Codd's Proof
